Selected US specifications from IPC sub-class A61K

(54) Cosmetic compositions for dyeing or for bleaching hair

- (57) A cosmetic composition suitable for dyeing or bleaching hair when mixed with an oxidizing solution, comprising, in an aqueous medium:
 - (a) at least one fatty acid soap,
 - (b) at least one cationic or amphoteric silicone polymer,
 - (c) at least one cationic surface-active agent,
 - (d) at least one alkalifying agent, and
- (e) at least one cationic polymer which is a quaternary polyammonium polymer, a vinylpyrrolidone/dialkylaminoalkyl acrylate or methacrylate copolymer (quaternized or not quaternized), a poly(methacrylamidopropyltrimethylammonium chloride), a cationic protein, a polyaminoamide, a crosslinked polyaminoamide, an alkylated polyaminoamide or a mixture thereof can be used to bleach hair or, if it additionally comprises an oxidation dye precursor and, if desired, a coupler and a reducing agent, can be used to dye hair.

SPECIFICATION

Cosmetic compositions for dyeing or for bleaching hair

| | The present invention relates to cosmetic compositions for dyeing or for bleaching hair intended to be diluted with an oxidizing solution at the time of use, and to their application to hair. In the technique for dyeing hair commenly called "permenant dyeing", oxidation dye precursors dissolved in a substrate with a basic pH and containing a reducing agent are used, these dye precursors being converted into dyes in the hair by condensation in the presence of an oxidizing agent which is generally hydrogen peroxide, the oxidizing agent being added to the substrate just before the application to hair. | 5 |
|----|--|----|
| 15 | In a technique for slight bleaching or lightening of hair, an ammoniacal oxidizing composition prepared just before use by mixing the oxidizing agent with an ammoniacal substrate is employed. If it is desired to obtain a higher degree of bleaching, a persalt, which is generally an alkali metal persulphate, is added to the ammoniacal oxidizing composition just before use. Compositions for dyeing or for bleaching hair, also called dyeing or bleaching substrates, are | 15 |
| 20 | Dyeing compositions or substrates which contain at least one fatty acid, at least one particular cationic polymer of the quaternary ammonium polymer type, benzyl alcohol and an alkalifying agent have been described in French Patent No. 2,402,446. This dyeing substrate is in the form of a stiff gelified cream which adheres well to hair and makes the hair easy to disentangle and | 20 |
| 25 | the hair from the roots to the tips. | 25 |
| 30 | a very silky touch. | 30 |
| 35 | aqueous medium: a) at least one fatty acid soap, b) at least one cationic or amphoteric silicone polymer, c) at least one cationic suface-active agent, | 35 |
| 40 | d) at least one alkalifying agent, and e) at least one cationic polymer which is a quaternary polyammonium polymer or "ionene", a vinylpyrrolidone dialkylaminoalkyl acrylate or methacrylate copolymer (quaternized or otherwise), a poly(methacryl-amido propyltrimethylammonium chloride), a cationic protein or a polyaminoamide which may be crosslinked or alkylated, or a mixture thereof. | 40 |
| 45 | When the composition or substrate is used in a dyeing composition, at least one oxidation dye precursor and at least one reducing agent are added. In this case a cationic polymer which is a cationic cyclopolymer may also be used. The fatty acid soaps used according to the invention are preferably alkali metal salts or the fatty acid soaps used according to the invention are preferably alkali metal salts or the | 45 |
| 50 | thyl-1-propanol, 2-amino-2-methyl-1,3-propanediol of thisopropantolarinity of C12-C18 tatty dolor, the fatty chain of which can be saturated or unsaturated. Examples of fatty acids are lauric, palmitic, oleic and myristic acids. Triethanolamine, monoethanolamine and 2-amino-2-methyl-1-propanol salts of lauric, palmitic | 50 |
| 51 | and oleic acids are the particularly preferred soaps. The cationic or amphoteric silicone polymers used according to the invention are preferably polysiloxanes in which one or more of the silicon atoms on the chain carries an aliphatic amino polysiloxanes in which one or more of the silicon atoms on the chain carries an aliphatic amino polysiloxanes in which one or more of the silicon atoms on the chain carries an aliphatic amino polysiloxanes in which one or more of the silicon atoms on the chain carries an aliphatic amino polysiloxanes. | |
| ٠. | group whose amine group is primary, secondary, tertiary, quaternary or is betainized. The term "aliphatic amino" covers aminoalkyl and aminohydroxyalkyl groups, the alkyl chain of which may optionally be interrupted by one or more nitrogen or oxygen atoms. | 55 |

ISDOCID: <GB___2188948A__i_

35

40

in which x and y, which may be identical or different, are integers such that the average molecular weight of the polymer is from 5,000 to 10,000. This polymer is also called "amodimethicone".

Other cationic silicone polymers which can be used according to the invention are those of

20
$$(R_1)_a G_{3-a} - Si(-OSiG_2)_n - [OSiG_b(R_1)_{2-b}]_m - O - SiG_{3-a}(R_1)_a$$
 20

in which

G is hydrogen or a phenyl, OH, or C₁-C₈ alkyl group, preferably a methyl group;

a is an integer from 0 to 3, preferably 0;

b is 0 or 1, preferably 1;
n is a number from 0 to 1,999, preferably from 49 to 149 and m is a number from 1 to

2,000, preferably from 1 to 10, such that the sum n+m is a number from 1 to 2,000, preferably from 50 to 150;

 R_1 is a monovalent group of formula $C_qH_{2q}L$ in which q is an integer from 2 to 8 and L is a 30 group of formula:

-N(R₂)CH₂-CH₂-N(R₂)₂,

-N(R₂)₂,

 $-{}^{\circ}N(R_2)_3A^{\circ}$, 35 $-{}^{\circ}N(R_2)H_2A^{\circ}$, or

-N(R2)CH2-CH2-®NR2H2A®

in which R_2 is hydrogen or a phenyl, benzyl or saturated hydrocarbon group, preferably an alkyl group containing from 1 to 20 carbon atoms, and A° is a halide ion.

These compounds are described in greater detail in European Patent Application No. 95,238.

A particularly preferred polymer of this formula "trimethylsilylamodimethicone" is of formula:

wherein n has a value of from 0 to 1,999, preferably from 49 to 149, and m has a value of from 1 to 2,000, preferably from 1 to 10, such that m+n has a value of from 1 to 2,000, preferably from 50 to 150.

Other cationic silicone polymers which may be used according to the invention are of formula:

20

40

65

$$R_{4}-CH_{2}-CHOHCH_{2}-\overset{\text{ex}}{\mathbb{R}}(R_{3})_{3}Q^{\text{ex}}$$

$$= \begin{bmatrix} R_{3} & 0 & 0 & 0 \\ S_{1} & 0 & 0 & 0 \\ R_{3} & S_{1} & 0 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} R_{3} & 0 & 0 & 0 \\ S_{1} & 0 & 0 & 0 \\ R_{3} & S_{1} & S_{2} & S_{3} & S_{3$$

10 in which: R_3 is a monovalent hydrocarbon group containing from 1 to 18 carbon atoms, preferably an

alkyl or alkenyl group such as a methyl group; R_4 is a hydrocarbon group optionally containing a chain oxygen atom, preferably a C_1-C_{18} alkylene group or a C1-C18, more preferably C1-C8, alkyleneoxy group;

15

15 Qo is a halide ion, preferably chloride; r has a statistical mean value of from 2 to 20, preferably of from 2 to 8; and

s has a statistical mean value of from 20 to 200, preferably of from 20 to 50.

These compounds are described in greater detail in US Patent 4,185,087.

A particularly preferred polymer of this class is that sold by Union Carbide under the name 20 "Ucar Silicone ALE 56".

It is also possible to use a cationic silicone polymer of formula:

sold under the trade name Abil 9905 by Goldschmidt or an amphoteric silicone polymer of

55 55

sold under the trade name Abil 9950 by Goldschmidt;

wherein, in each case, p and q are such that the average molecular weight of each product is

DOCID: <GB___2188948A__I_>

20

25

30

35

40

from 1,000 to 8,000.

The cationic surfactants used according to the invention preferably have the formula (IV):

10 in which:

10 (1) R₅ and R₆ are both methyl groups,

i) R₇ and R₈, which may be identical or different, are each a linear aliphatic group, preferably an alkyl group containing from 12 to 22 carbon atoms or an aliphatic group derived from a tallow fatty acid containing from 14 to 22 carbon atoms,

ii) R₇ is a straight-chain aliphatic group, preferably an alkyl group containing from 14 to 22 carbon atoms, and R₈ is a methyl or benzyl group,

iii) R_7 is an alkylamidopropyl ($C_{14}-C_{22}$ alkyl) group and R_8 is an alkylacetate ($C_{12}-C_{16}$ alkyl)

iv) R₇ is a γ-gluconamidopropyl group, an aliphatic group derived from a tallow fatty acid or a

20 C₁₆-C₁₈ alkyl group and R₈ is a hydroxyethyl group, and Xº is an anion such as a halide or methosulphate ion;

(2) R_B is an alkylamidoethyl or alkenylamidoethyl group, wherein the alkyl or alkenyl moiety contains from 14 to 22 carbon atoms and originates from a tallow fatty acid,

Rs and R7 form, together with the nitrogen to which they are attached, a 2-alkyl-4,5-dihydroim-25 idazole heterocyclic ring wherein the alkyl moeity is derived from a tallow fatty acid.

R_s is a methyl group, and

Xº is a methosulphate ion; or

(3) R₅, R₆ and R₇ form, together with the nitrogen to which they are attached, a six membered aromatic heterocyclic ring, R₈ is a C₁₄-C₁₈ alkyl group and X^o is a halide anion.

Preferred cationic surface-active agents are: dimethylalkyl-(C18) ammonium chloride sold under the name "Genamine DSAC" by Hoechst, trimethylalkyl- $(C_{20}-C_{22})$ ammonium chloride sold under the trade name "Genamine KDM-F" by Hoechst, cetylpyridinium chloride, dimethyldialkyl(C12-C14) ammonium chloride, dimethyl-y-gluconamidopropylhydroxyethylammonium chloride sold under the

name "Ceraphyl 60" by Van Dyk, dimethyldicetylammonium chloride sold under the trade name "Noramium M2 SH", dimethyl dilauryl ammonium chloride sold under the trade name "Noramium M2 CD", dimethylhydroxyethylalkyl(tallow)ammonium chloride, dimethyl dialkyl (hydrogenated tallow)ammonium chloride sold under the trade name ARQUAT 2H 75, dimethylhydroxyethylcetylammonium chloride and dimethylstearylbenzylammonium chloride sold under the trade names "Ammonyx 4002" by Onyx or "Catigene CS 40" by Stepan. The cationic polymers used 40 according to the invention are preferably:

1) quaternary ammonium polymers consisting of recurring repeat units, which may be identical or different, of formula (V):

wherein:

R₁, R₂, R₃ and R₄, which may be identical or different, are each an aliphatic, alicyclic or 55 arylaliphatic group containing from 1 to 20 carbon atoms or a C₁-C₈, preferably C₁-C₄, hydroxyaliphatic group, or at least one of a pair of R₁ and R₂ and/or R₃ and R₄ form, together with the nitrogen to which they are attached, a heterocyclic ring optionally containing a second heteroatom other than nitrogen, or

R₁, R₂, R₃ and R₄, which may be identical or different, are each a linear or branched C₂-C₆ alkyl 60 group substituted by a nitrile, ester, acyl or amide group or by a group of formula:

BNSDOCID: <GB 2188948A L >

Or

10

wherein:

R'₇ is an alkylene group, and

15

D is a quaternary ammonium group;
A and B, which may be identical or different, are each an aliphatic hydrocarbon group containing from 2 to 20 carbon atoms, which is linear or branched, saturated or unsaturated and which optionally contains, inserted into the main chain, one or more aromatic rings or one or more oxygen or sulphur atoms or one or more sulphoxide, sulphone, disulphide, amine, alkylam-20 ine, quaternary ammonium, hydroxyl, ureido, amide or ester groups; or

20

A, R₁ and R₃, together with the two nitrogen atoms to which they are attached, form a piperazine ring;

each X°, which may be identical or different, is an anion derived from an inorganic or organic

acid; and

n is such that the molecular mass of the polymer is from 1,000 to 100,000. Polymers of this type are described, in particular, in French Patents 2,320,330, 2,270,846 and 2,316,271 and in US Patents 2,273,780, 2,375,853, 2,388,614, 2,454,547, 3,206,462, 2,261,002 and 2,271,378.

Other polymers of this type are described in US Patents 3,874,870, 4,001,432, 3,929,990,

30 3,966,904 and 4,005,193.

30

25

Other preferred polymers are those which contain one of the following repeat units:

in which n is approximately 6 and which is sold nder the name "Mirapol A 15" by Miranol; and poly(dimethylbutenylammonium chloride)- α , ω -bis-(triethanolammonium chloride) sold under the trade name "Onamer M" by Onyx Chemical.

2) Quaternary ammonium polymers consisting of repeat units, which may be identical or 55 different, of formula (VI):

55

65

50

$$60 = \begin{bmatrix} R_4 \\ N - (CH_2)_x - NH - C - (CH_2)_m \\ R_5 \end{bmatrix} = NH - (CH_2)_y - \begin{pmatrix} R_6 \\ N - A \\ R_7 \end{pmatrix}$$

wherein:

 R_4 , R_5 , R_8 and R_7 , which may be identical or different, are each hydrogen, a methyl, ethyl,

BNSDOCID: <GB 2188948A | >

propyl, 2-hydroxyethyl or 2-hydroxypropyl group or a group of formula -CH2-CH2-(O-CH₂-CH₂))_p-OH in which p is an integer from 0 to 6;

with the proviso that R₄, R₅, R₆ and R₇ are not all simultaneously hydrogen:

x and y, which may be identical or different, are each integers from 1 to 6; m is an integer from 0 to 34;

each Xe, which may be identical or different, is a halogen anion; and A is a divalent hydrocarbon group optionally containing a chain oxygen atom, preferably a group of formula:

These compounds are described in European Patent 122,324.

The quaternary ammonium polymers which are particularly preferred are those which contain either of the following repeat units:

wherein each X, which may be identical or different, is a halogen, sold under the trade name 25 "Mirapol AD1" by Miranol, or:

35 wherein each X, which may be identical or different, is a halogen, sold under the trade name "Mirapol AZ1" by Miranol.

3) Poly(methacrylamidopropyltrimethylammonium chloride) sold under the trade name "Polymaptac" by Texaco Chemicals.

4) Vinylpyrrolidonedialkylaminoalkyl acrylate or methacrylate copolymers (quaternized or other-40 wise), such as those sold under the trade names "Gafquat" by GAF Corporation, such as, for example, "copolymer 845" and "Gafquat 734 or 755" which are described in French Patents 2,077,143 and 2,393,573.

5) Cationic proteins which are chemically modified polypeptides which contain, either at the end of the chain or grafted onto the chain, at least one amine or quaternary ammonium group. 45 Preferred proteins are:

collagen hydrolysates containing triethylammonium groups, such as the products sold under the trade name "Quat-Pro E" by Maybrook and called "Triethonium Hydrolyzed Collagen Ethosulphate" in the CTFA dictionary (CTFA is the abbreviation for The Cosmetic, Toiletry and Fragrance Association Inc., 1110 Vermont Avenue N.W. Washington DC 20005 U.S.A., who 50 publish the "Cosmetic Ingredient Dictionary" 3rd edition);

collagen hydrolysates containing trimethylammonium or trimethylstearylammonium chloride groups sold under the trade name "Quat-Pro S" by Maybrook and called "Steartrimonium Hydrolyzed Collagen" in the CTFA dictionary;

animal protein hydrolysates containing trimethylbenzylammonium groups, such as the products 55 sold under the trade name "Crotein BTA" by Croda and called "Benzyltrimonium hydrolyzed animal protein" in the CTFA dictionary;

protein hydrolysates containing, on the polypeptide chain, quaternary ammonium groups containing at least one alkyl group containing from 1 to 18 carbon atoms, such as:

Croquat L, the polypeptide chain of which has an average molecular weight of approximately 60 2,500 and the quaternary ammonium group of which contains a C₁₂ alkyl group;

Croquat M, the polypeptide chain of which has an average molecular weight of approximately 2,500 and the quaternary ammonium group of which contains a C10-C18 alkyl group;

Croquat S, the polypeptide chain of which has an average molecular weight of approximately 2,700 and the quaternary ammonium group of which contains a C18 alkyl group;

BNSDOCID: < 65 218 Croatein Q, the polypeptide chain of which has an average molecular weight of the order of

12,000 and the quaternary ammonium group of which contains at least one alkyl group containing from 1 to 18 carbon atoms.

These different products are sold by Croda.

Other preferred quaternized proteins are those of formula:

5

in which

A is a protein residue derived from a collagen protein hydrolysate, R_5 is a lipophilic group containing up to 30 carbon atoms, Re is an alkylene group containing from 1 to 6 carbon atoms, and

Xº is an anion: the protein having a molecular weight of from 1,500 to 10,000, preferably from 2,000 to

5,000. The preferred product is that sold under the trade name "Lexein QX 3000" by Inolex 20 and is called "Cocotrimonium Collagen Hydrolysate" in the CTFA dictionary.

Other preferred proteins are hydrolysates of animal proteins, which contain dimethylamine groups, which are sold under the trade name "Lexein CP 125" by Inolex and referred to under the name "Oleamidopropyl dimethylamine hydrolyzed animal protein" in the CTFA dictionary.

6) Water soluble polyaminoamides, prepared by the polycondensation of an acid compound 25 with a polyamine. These polyaminoamides may be crosslinked and alkylated. Such polymers are described in French Patents 2,252,840 and 2,368,508.

Other polyaminoamides resulting from the condensation of polyalkylenepolyamines with polycarboxylic acids and which are alkylated with difunctional agents may be used, for example, adipic acid/dialkylaminohydroxyalkyl/dialkylenetriamine polymers in which the alkyl moiety con-30 tains from 1 to 4 carbon atoms. Such polymers are described in French Patent 1,583,363.

Examples of such derivatives are adipic acid/dimethylaminohydroxypropyl/diethylenetriamine polymers, sold under the trade names "Cartaretine F, F4 or F8" by Sandoz.

Further examples of polyaminoamides are those obtained by the reaction of a polyalkylenepolyamine comprising two primary amine groups and at least one secondary amine group with a dicarboxylic acid, the molar ratio between the polyalkylenepolyamine and the dicarboxylic acid being from 0.8:1 to 1.4:1, the resulting polyaminoamide subsequently being reacted with epichlorohydrin, the molar ratio of epichlorohydrin to the secondary amine groups of the polyamide being from 0.5:1 to 1.8:1. Such polymers are described in US Patents 3,227,615 and 2,961,347.

A group of polymers which may be used advantageously in the dye compositions comprising oxidation dye precursors and a reducing agent are cyclopolymers with a molecular weight of from 20,000 to 3,000,000, comprising units of formula (VII) or (VIII):

55 in which:

1 and t are each 2 or 1 and the sum I+t is 1;

each R", which may be identical or different, is hydrogen or a methyl group;

R and R', which may be identical or different, are each an alkyl group containing from 1 to 22 carbon atoms, a hydroxyalkyl group in which the alkyl group preferably contains from 1 to 5 60 carbon atoms, or a lower amidoalkyl group, or R and R' may form, together with the nitrogen to which they are attached, a heterocylic group such as piperidyl or morpholinyl;

or copolymers comprising units of formula (VIII) or (VIIII) and units derived from acrylamide or

diacetoneacrylamide,

and Ye is an anion, such as bromide, chloride, acetate, borate, citrate, tartrate, bisulphate, 65 bisulphite, sulphate or phosphate.

65

60

5

10

15

20

35

45

50

55

Preferred cyclopolymers are a hompolymer of dimethyldiallylammonium chloride sold by Merck under the trade name "Merquat 100", which has a molecular weight of less than 100,000, and a copolymer of dimethyldiallylammonium chloride with acrylamide which has a molecular weight of more than 500,000 and which is sold under the trade name "Merquat 550" by Merck.

The alkalifying agents used in accordance with the invention may, for example, be sodium or potassium hydroxide, aqueous ammonia, or alkanolamines such as those used to form the soap. These alkalifying agents are generally used in a sufficient quantity for the pH of the substrate to be higher than 7, preferably higher than 8. Aqueous ammonia is preferred.

When the substrate is employed in a dye composition, it additionally contains at least one oxidation dye precursor and at least one reducing agent. The reducing agent is preferably thioglycolic acid, thiolactic acid, ammonium thiolactate or sodium metabisulphite. It is preferably used in an amount of from 0.5 to 2% by weight relative to the total weight of the composition.

The oxidation dye precursors are preferably aromatic compounds of the diamine, aminophenol or phenol type.

Among these oxidation dyes there may be distinguished bases which are para or ortho derivatives such as diamines and mono- or diamino- phenols and compounds R5 which are known as modifiers or couplers which are meta derivatives chosen form meta-diamines, meta-aminophenols, phenols and polyphenols.

Examples of para-phenylenediamines which can be used in the compositions according to the 20 invention, are primary, secondary and tertiary para-phenylenediamines, optionally substituted on the benzene ring, preferably those of formula:

in which:

R₇ and R₈, which may be identical or different, are each hydrogen or a straight or branched chain lower alkyl group, mono- or polyhydroxylated alkyl, piperidinoalkyl, carbamylalkyl, dialkyl-carbamylalkyl, aminoalkyl, monoalkylaminoalkyl, dialkylaminoalkyl, omega-aminosulphonylalkyl, carboxyalkyl, alkylsulphonamidoalkyl, arylsulphonamidoalkyl, morpholinoalkyl, acylaminoalkyl, sulphoalkyl or alkoxyalkyl group, in which groups the alkyl moeity preferably contains from 1 to 4 carbon atoms;

or R₇ and R₈ form, together with the nitrogen to which they are attached, a heterocyclic group, 40 preferably containing 5 or 6 ring members, such as morpholine or piperidine; and

R₅, R₈, R₉ and R₁₀, which may be identical or different, are each hydrogen, a halogen or a lower alkyl group, preferably containing 1 to 4 carbon atoms, or a group of formula —OZ wherein Z is a hydroxyalkyl, alkoxyalkyl, acylaminoalkyl, carbalkoxyaminoalkyl, mesylaminoalkyl, ureidoalkyl, aminoalkyl or mono- or dialkylaminoalkyl group.

In the above definition, halogen may mean fluorine bromine or, preferably, chlorine.

These p-phenylenediamines may be introduced into the dye composition in the form of free base or in salt form, for example in the form of their hydrochloride, hydrobromide, sulphate or tartrate salts.

Other oxidation bases are p-aminophenol or a homologue thereof whose aromatic nucleus is substituted by at least one methyl group or by chlorine; N-methyl-p-aminophenol, a heterocyclic derivative of piperidine or of benzomorpholine, 5-amino-indole, ortho-aminophenol, p-aminodiphenylamine or an ortho-phenylenediamine or a substituted derivative thereof. The oxidation bases are generally used in an amount of from 0.01 to 5% by weight relative to the total weight of the composition.

The dyeing compositions may contain at least one coupler, in addition to one or more oxidation bases. A preferred coupler has the formula:

65 wherein: BNSDOCID: <GB__2188948A_I_>

R₁₁ and R₁₂, which may be identical or different, are each a hydroxyl group or a group of formula -NHR, wherein R is hydrogen or an acyl, ureido, carbalkoxy,, carbamylalkyl, alkyl, dialkylcarbamylalkyl, hydroxyalkyl or mesylaminoalkyl group; one of R11 and R12 also being able to be hydrogen or an alkoxy or alkyl group, provided that the other is a hydroxyl group; R₁₃ and R₁₄, which may be identical or different, are each hydrogen or a halogen, an amino, 5 alkylamino, acylamino, ureido, a branched or linear alkyl group or a group of formula OZ Wherein Z is a hydroxyalkyl, polyhydroxyalkyl, alkoxyalkyl, mesylaminoalkyl, acylaminoalkyl, ureidoalkyl or carbalkoxyalkyl group. Other couplers which may be used in the compositions according to the invention are, for 10 10 example, alpha-naphthol, and heterocyclic compounds derived from benzomorpholine, pyridine, pyrazolones or diketone compounds. The couplers are generally used in an amount of from 0.001 to 5% by weight relative to the total weight of the composition. Direct dyes may be added to these oxidation dyes in order to impart highlights to the final colour. The fatty acid soaps used in the compositions according to the invention are preferably 15 present in an amount of from 1 to 25%, more preferably from 2 to 20%, by weight relative to 15 the weight of the composition. The cationic silicone polymers defined above are preferably present in an amount of from 0.05 to 5%, more preferably from 0.1 to 3%, by weight relative to the total weight of the composition. The cationic surface-active agents are preferably used in an amount of from 0.05 to 5% by 20 20 weight relative to the total weight of the composition. The cationic polymers are preferably used in an amount of from 0.05 to 5% by weight relative to the total weight of the composition. The cationic silicone polymers which are particularly preferred may be introduced into the 25 compositions according to the invention in the form of emulsions containing the silicone polymer 25 as well as nonionic and cationic surface-active agents. An emulsion of this type which is particularly preferred is a composition sold under the trade name of cationic emulsion "Dow Corning 929" (DC 929) by Dow Corning and which is a combination of: 30 a) "amodimethicone" as hereinbefore defined; 30 b) trimethyalkyl(tallow)ammonium chloride of formula: 35 $c_{1}\Theta$ 40 wherein R_4 is a mixture of alkenyl and/or alkyl groups containing from 14 to 22 carbon atoms, 40 derived from a tallow fatty acid; and c) polyoxyethylenated nonylphenol of formula: $C_9H_{19}-C_6H_4-(OC_2H_4)_{10}-OH.$ 45 45 Another emulsion based on cationic silicone polymers which can be used in the present invention is a composition sold under the trade name "Dow Corning Q2 7224" by Dow Corning and which is a combination of: a) trimethylsilylamodimethicone as hereinbefore defined; 50 b) polyoxyethylenated octylphenol of formula: 50 C₈H₁₇-C₆H₄-(OCH₂CH₂),OH wherein n is 40; 55 c) polyoxyethylenated lauryl alcohol of formula: 55 C₁₂H₂₅-(OCH₂CH₂)₀OH wherein n is 6; and 60 60 d) glycol. The dye or bleaching agent substrates according to the invention may additionally contain various conventional adjuvants. These adjuvants may, for example, be solvents, fatty amides, natural or synthetic fatty alcohols, nonionic or amphoteric surfactants, sequestering agents, antioxidants or perfumes. The substrates or compositions according to the invention generally

65 comprise from 0 to 20% of solvents, from 0 to 15% of fatty amides, from 0 to 25% of fatty

| | of the composition. | |
|----|---|----|
| 5 | The solvents are generally lower aliphatic alcohols such as ethanol, propanol and isopropanol; glycols such as ethylene glycol, propylene glycol, diethylene glycol, dipropylene glycol and hexylene glycol; glycol ethers such as methylglycol, ethylglycol, butylglycol and diethylene glycol monoethyl ether; or aromatic alcohols, especially benzyl alcohol or phenoxyethanol. Examples of fatty amides are lauric, oleic or copra mono- or diethanolamides and stearic | 5 |
| 10 | monoethanolamide. These amides are generally used in an amount of from 0.5 to 15%, preferably from 1 to 10%, by weight relative to the total weight of the composition. The natural or synthetic fatty alcohols generally contain from 10 to 18 carbon atoms and are preferably used in an amount of from 1 to 25%, more preferably from 5 to 15%, by weight relative to the total weight of the composition. | 10 |
| 15 | Examples of nonionic surfactants are C ₈ -C ₁₈ fatty alcohols oxyethylenated with 5 to 30 moles of ethylene oxide, alkylphenols oxyethylenated with 2 to 30 moles of ethylene oxide, alcohols, 1,2-alkanediols and amides polyglycerolated with 1 to 10 moles of glycerol. Throughout this text, the concentrations of various constituents are relative to the composition before dilution with the oxidizing agent. By a "lower" group or moeity is meant one which generally contains from 1 to 6 or 1 to 4 carbon atoms. | 15 |
| 20 | Another subject of the invention is a hair-dyeing composition obtained by mixing the substrate specified above, containing the oxidation dye precursors and the reducing agent, with an oxidizing solution, which generally consists of hydrogen peroxide. | 20 |
| 25 | The present invention also provides a process for bleaching hair which comprises applying to the hair a composition as defined above and 0.5 to 3 parts per part of the composition by weight of an oxidizing agent or solution which is hydrogen peroxide or a persalt or a mixture thereof, leaving them in contact with the hair for a sufficient time to bleach it, after which the hair is rinsed with water and the hair is dried. | 25 |
| 30 | The present invention further provides a process for dyeing hair which comprises applying to the hair a dyeing composition as defined above and 0.5 to 3 parts per part of the composition by weight of an oxidizing agent or solution which is hydrogen peroxide or a persalt or a mixture thereof, leaving them in contact with the hair for a sufficient time to produce the desired colour and rinsing and drying the hair. | 30 |
| 35 | Preferred persalts are alkali metal persulphates, perborates and urea peroxide. The composition may be mixed with the oxidizing agent or solution before application to the hair. The hair-dyeing or bleaching compositions are applied to hair in sufficient quantity to produce the desired shade or bleaching. The invention is now further explained in the following Examples. The parts are expressed on | 35 |
| 40 | a weight basis. | |

Dimethyldilaurylammonium chloride

UCAR SILICONE ALE 56 (Union Carbide) Cationic silicone polymer with a flash point of 60°C according to the ASTM standard D-93, and, at a concentration of 35% of active substance, a viscosity of 11 centipoises at 25°C and a 25 basicity index of 0.24 milliequivalent/gram.

CLAIMS

30

1. A cosmetic composition suitable for dyeing or bleaching hair when mixed with an oxidizing solution, comprising, in an aqueous medium:

(a) at least one fatty acid soap,

(b) at least one cationic or amphoteric silicone polymer,

(c) at least one cationic surface-active agent,

(d) at least one alkalifying agent, and

(e) at least one cationic polymer which is a quaternary polyammonium polymer, a vinylpyrroli-35 done/dialkylaminoalkyl acrylate or methacrylate copolymer (quaternized), a poly(methacrylamidopropyltrimethylammonium chloride), a cationic protein, a polyaminoamide, a crosslinked polyaminoamide, an alkylated polyaminoamide or a mixture thereof.

2. A cosmetic composition suitable for dyeing hair when mixed with an oxidizing agent, comprising, in an aqueous medium:

(a) at least one fatty acid soap,

(b) at least one cationic or amphoteric silicone polymer,

(c) at least one cationic surface-active agent,

(d) at least one alkalifying agent, and

(e) at least one cationic polymer which is a quaternary polyammonium polymer, a vinylpyrroli-45 done/dialkylaminoalkyl acrylate or methacrylate copolymer (quaternize or not quaternized), a poly(methacrylamidopropyltrimethylammonium chloride), a cationic protein, a polyaminoamide, a crosslinked polyaminoamide, an alkylated polyaminoamide, a cationic cyclopolymer or a mixture thereof.

f) at least one oxidation dye precursor, and

g) at least one reducing agent.

3. A composition according to claim 1 or 2 wherein the fatty acid soap is an alkali metal salt or alkanolamine salt of a C12-C18 fatty acid containing a saturated or unsaturated fatty chain, or a mixture thereof.

4. A composition according to any one of claims 1 to 3 wherein the fatty acid soap is 55 present in an amount of from 1 to 25% by weight relative to the total weight of the composition.

A composition according to claim 4 wherein the fatty acid soap is present in an amount of from 2 to 20% by weight.

6. A composition according to any one of claims 1 to 5 wherein the cationic or amphoteric 60 silicone polymer is a polysiloxane in which one or more of the silicon atoms in the chain carries an aliphatic amino group whose amine group is primary, secondary, tertiary or quaternary or is betainized, or a mixture thereof.

7. A composition according to claim 6 wherein the cationic silicone polymer is

(i) a polymer known as "amodimethicone" of formula:

20

10

25

30

35

40

45

50

55

25

50

55

in which x and y, which may be identical or different, are integers such that the average molecular weight of the polymer is from 5,000 to 10,000; (ii) a polymer of formula:

$$(R_1)_aG_{3-a}-Si(-OSiG_2)_n-[OSiG_b(R_1)_{2-b}]_m-O-SiG_{3-a}(R_1)_a$$

20 in which:

G is hydrogen or a phenyl, OH, or C₁-C₈ alkyl group;

a is an integer from 0 to 3;

b is 0 or 1;

n is a number from 0 to 1,999 and m is a number from 1 to 2,000 such that the sum n+m 25 is a number from 1 to 2,000;

 R_1 is a monovalent group of formula $C_qH_{2q}L$ in which q is an integer from 2 to 8 and L is a group of formula:

$$-N(R_2)CH_2-CH_2-N(R_2)_2,$$
30 $-N(R_2)_2$, $-N^{\circ}(R_2)_3A^{\circ}$, 30

 $-N^{\odot}(R_2)H_2A^{\odot}$, or

-N(R₂)CH₂-CH₂-N^oR₂H₂ A^o

35 in which R₂ is hydrogen or a phenyl, benzyl, or saturated hydrocarbon group and A[®] is a halide 35 ion;

(iii) a polymer of formula:

40
$$R_{4}-CH_{2}-CHOH-CH_{2}-N^{2}(R_{3})_{3} = Si - 0$$

$$R_{5}i - 0$$

$$R_{3} = Si - 0$$

$$R_{3} = Si$$

in which:

R₃ is a monovalent hydrocarbon group containing from 1 to 18 carbon atoms;

 R_4 is a hydrocarbon group optionally containing a chain oxygen atom; Q^{\odot} is a halide ion;

r has a statistical average value of from 2 to 20; and s has a statistical average value of from 20 to 200;

55 (iv) a polymer of formula:

40

45

50

55

60

20 wherein p and q are such that the average molecular weight is from 1,000 to 8,000, sold under 20 the trade name "ABIL 9905" by Goldschmidt; or (v) an amphoteric silicone polymer of formula:

wherein p and q are such that the average molecular weight is from 1,000 to 8,000, sold under the trade name ABIL 9950 by Goldschmidt. 8. A composition according to claim 7 wherein the cationic silicone polymer is as defined in section (ii) wherein:

G is a methyl group; 45

a is 0;

b is 1;

40

n is a number from 49 to 149 and m is a number from 1 to 10 such that the sum n+m is a number from 50 to 150; and

R₂ is an alkyl group containing from 1 to 20 carbon atoms. 9. A composition according to claim 7 wherein the cationic silicone polymer is as defined in 50 section (iii) wherein:

R₃ is an alkyl or alkenyl group;

 R_4 is a C_1-C_{18} alkylene group or a C_1-C_{18} alkyleneoxy group;

Q- is a chloride ion; 55 r has a statistical average value of from 2 to 8; and

s has a statistical average value of from 20 to 50.

10. A composition according to claim 9 wherein R₃ is a methyl group and R₄ is a C₁-C₈ alkyleneoxy group.

11. A composition according to claim 7 wherein the cationic silicone polymer is:

(i) the polymer known as "trimethylsilylamodimethicone" of formula:

PNEDOCIO: -CP

20

35

40

45

50

wherein n has a value of from 0 to 1,999 and m has a value of from 1 to 2,000 such that m+n has a value of from 1 to 2,000, or

(ii) a polymer sold by Union Carbide under the name "Ucar Silicone ALE 56".

12. A composition according to any one of claims 1 to 11 wherein the cationic or amphoteric silicone polymer is present in an amount of from 0.05 to 5% by weight relative to the total weight of the composition.

13. A composition according to claim 12 wherein the cationic or amphoteric silicone polymer is present in an amount of from 0.1 to 3% by weight.

14. A composition according to any one of claims 1 to 13 wherein the cationic surface-active agent is a compound of formula:

in which

(1) R_5 and R_5 are both methyl groups,

i) R₇ and R₈, which may be identical or different, are each a linear aliphatic group,

ii) R₇ is a linear aliphatic group and R₈ is a methyl or benzyl group, or

iii) R₇ is an alkylamidopropyl group and R₈ is an alkylacetate group, or

iv) R_7 is a gamma-gluconamidopropyl group, an aliphatic group derived from a tallow fatty acid or a C_{16} – C_{18} alkyl group, and R_8 is a hydroxyethyl group, and X° is an anion; or

(2) R_s is an alkylamidoethyl or alkenylamidoethyl group, wherein the alkyl or alkenyl moiety contains from 14 to 22 carbon atoms and originates from a tallow fatty acid, R_s and R₇ form, together with the nitrogen to which they are attached, a 2-alkyl-4,5-dihydroimidazole heterocyclic ring wherein the alkyl moiety is derived from a tallow fatty acid, R_s is a methyl group and X° is a methosulphate ion; or

(3) R₅, R₆ and R₇ form, together with the nitrogen to which they are attached, a six membered aromatic heterocyclic ring, R₈ is a C₁₄-C₁₈ alkyl group and X⁶ is a halide anion; or a mixture thereof.

15. A composition according to claim 14 in which:

(1) Rs and Rs are both methyl groups,

i) R₇ and R₈, which may be identical or different, are each an alkyl group containing from 12 to
 50 22 carbon atoms or an aliphatic group derived from at least one tallow fatty acid containing from 14 to 22 carbon atoms,

ii) R_7 is a linear alkyl group containing from 14 to 22 carbon atoms and R_8 is a methyl or benzyl group, or

iii) R₇ is an alkylamidopropyl group wherein the alkyl moiety contains from 14 to 22 carbon
 55 atoms and R₈ is an alkylacetate group wherein the alkyl moiety contains from 12 to 16 carbon
 55 atoms, and

Xºis a halide or methosulphate anion, or a mixture thereof.

16. A composition according to any one of claims 1 to 13 wherein the cationic surface-active agent is dimethyl dialkylammonium chloride sold under the name "Noramium M2 CD:,
60 dimethyl dialkyl (hydrogenated tallow) ammonium chloride sold under the name "Arquat 2H 75", 60 dimethyldialkyl(C₁₀-ammonium chloride sold under the name "Genamine DSAC" by Hoechst, trimethylalkyl(C₂₀-C₂₂)-ammonium chloride sold under the trade name "Genamine KDM-F" by Hoechst, cetylpyridinium chloride, dimethyldialkyl-(C₁₂-C₁₄)ammonium chloride, dimethyl-gamma-glyconamidopropylhydroxyethylammonium chloride sold under the trade name "Ceraphyl 60" by

van Dyk, dimethyldicetylammonium chloride sold under the trade name "Noranium M2 SH",

5

10

15

40

50

dimethylhydroxyethylalkyl(tallow)ammonium chloride, dimethylhydroxyethylacetylammonium chloride, or dimethylstearylbenzylammonium chloride sold under the trade names "Ammonyx 4002" by Onyx or "Catigene CS 40" by Stepan, or a mixture thereof.

- 17. A composition according to any one of claims 1 to 16 wherein the cationic surface-5 active agent is present in an amount of from 0.05 to 5% by weight relative to the total weight of the composition.
 - 18. A composition according to any one of claims 1 to 17 wherein the alkalifying agent is sodium hydroxide, potassium hydroxide, aqueous ammonia or an alkanolamine.
- 19. A composition according to claim 18 wherein the alkalifying agent is mono-, di- or 10 triethanolamine, 2-amino-2-methyl-1-propanol, 2-amino-2-methyl-1,3-propanediol or triisopropanolamine.
 - 20. A composition according to any one of claims 1 to 19 wherein the cationic polymer comprises a quaternary polyammonium polymer which is:
- 1) a polymer consisting of recurrent repeat units, which may be identical or different, of 15 formula (V):

wherein

- 25 R₁, R₂, R₃ and R₄, which may be identical or different, each are an aliphatic, alicyclic or arylaliphatic group containing from 1 to 20 carbon atoms or a C₁-C₆ hydroxyaliphatic group, or at least one of a pair of R₁ and R₂ and/or R₃ and R₄, form, together with the nitrogen to which they are attached, a heterocyclic ring optionally containing a second heteroatom other than nitrogen,

 30 or R₁, R₂, R₃ and R₄, which may be identical or different, are each branched C₂-C₆ alkyl group

 30
- or R_1 , R_2 , R_3 and R_4 , which may be identical or different, are each branched C_2 – C_6 alkyl group substituted by a nitrile, ester, acyl or amide group or by a group of formula

Оľ

40 0 - C - NH - R', - D

45 wherein 45

R7' is an alkylene group, and

D is a quaternary ammonium group;

A and B, which may be identical or different, are each an aliphatic hydrocarbon group containing from 2 to 20 carbon atoms, which is linear or branched, saturated or unsaturated and which optionally contains, in the main chain, one or more aromatic rings or one or more oxygen or sulphur atoms or one or more sulphoxide, sulphone, disulphide, amine, alkylamine, quaternary ammonium, hydroxyl, ureido, amide or ester groups,

or A, R_1 and R_3 , together with the two nitrogen atoms to which they are attached, form a piperazine ring;

55 each X^o, which may be identical or different, is an anion derived from an inorganic or organic 55 acid: and

n is such that the molecular weight of the polymer is from 1,000 to 100,000;

(2) a polymer consisting of repeat units, which may be identical or different, of formula (VI):

RNSDOCID-ZGR 21889484 IS

5

10

15

40

wherein:

 R_4 , R_5 , R_6 and R_7 , which may be identical or different, are each hydrogen, a methyl, ethyl, propyl, 2-hydroxyethyl or 2-hydroxypropyl group or a group of formula $-CH_2-CH_2-(O-CH_2-CH_2)$ OH wherein p is an integer from 0 to 6;

with the proviso that R₄, R₅, R₆ and R₇ are not all simultaneously hydrogen; x and y, which may be identical or different, are each integers from 1 to 6; m is an integer 0 to 34;

each Xo, which may be identical or different, is a halogen anion, and

A is a divalent hydrocarbon group optionally containing a chain oxygen atom.

10 21. A composition according to claim 20 wherein A is a group of formula:

-CH2-CH2-O-CH2-CH2-

22. A composition according to claim 20 or 21 wherein the quaternary polyammonium 15 polymer consists of one of the repeat units:

wherein n is equal to approximately 6,

40 wherein each X, which may be identical or different, is a halogen,

wherein each X, which may be identical or different, is a halogen, or poly(dimethylbutenylam-monium chloride) α , ω -bis(triethanolammonium chloride).

50 23. A composition according to any one of claims 1 to 22 wherein the cationic polymer is present in an amount of from 0.05 to 3% relative to the total weight of the composition.

24. A composition according to any one of claims 1 to 23 wherein the cationic polymer comprises a cationic protein which is a chemically modified polypeptide bearing at least one amine or quaternary ammonium group at the end of, or grafted onto, the chain.

25. A composition according to claim 24 wherein the cationic protein is: a collagen hydrolysate containing triethylammonium groups, such as the products sold under the trade name "Quat-Pro E" by Maybrook and called "Triethonium Hydrolyzed Collegen Ethosulfate" in the CTFA dictionary;

a collagen hydrolsate containing trimethylammonium or trimethylstearylammonium chloride 60 groups, sold under the trade name "Quat-Pro S" by Maybrook and called "Steartrimonium Hydrolyzed Collagen" in the CTFA dictionary;

an animal protein hydrolysate containing trimethylbenzylammonium groups, such as the products sold under the trade name "Crotein BTA" by Croda and called "Benzyltrimonium hydrolyzed animal protein" in the CTFA dictionary;

a protein hydrolysate containing, on the polypeptide chain, quaternary ammonium groups

65

55

10

20

25

35

40

45

50

comprising at least one alkyl group containing from 1 to 18 carbon atoms, such as Croquat L, whose polypeptide chain has an average molecular weight of approximately 2,500 and whose quaternary ammonium group contains a C_{12} alkyl group;

Croquat M, whose polypeptide chain has an average molecular weight of approximately 2,500

5 and whose quaternary ammonium group contains a C₁₀-C₁₈ alkyl group;

Croquat S, whose polypeptide chain has an average molecular weight of approximately 2,700

and whose quaternary ammonium group contains a C₁₈ alkyl group;

Crotein Q, whose polypeptide chain has an average molecular weight of the order of 12,000 and whose quaternary ammonium group contains at least one alkyl group containing from 1 to 10 18 carbon atoms;

a protein of formula:

in which

20 A is a protein residue derived from a collagen protein hydrolysate,

 R_{S} is a lipophilic group containing up to 30 carbon atoms, R_{B} is an alkylene group containing from 1 to 6 carbon atoms; and

Xº is an anion, the protein having a molecular weight of from 1,500 and 10,000; or

an animal protein hydrolysate bearing dimethylamine groups, sold under the name of "Lexein 25 CP 125" by Inolex and referred to by the name "Oleamidopropyl dimethylamine hydrolyzed animal protein" in the CTFA dictionary.

26. A composition according to claim 25 wherein the cationic protein is a protein of formula:

30
$$R_5 - N - R_6 - NH - A$$
 30 CH_3

wherein A, $R_{\rm s}$ and $R_{\rm s}$ are as defined in claim 25, having a molecular weight of from 2,000 to 5,000 and is a product sold under the trade name "Lexein QX 3000" by Inolex and called "Cocotrimonium Collagen Hydrolysate" in the CTFA dictionary.

27. A composition according to any one of claims 1 to 26 wherein the cationic polymer 40 comprises a polyaminoamide which is:

(i) a water-soluble polyaminoamide obtained by condensation of an acidic compound with a polyamine, which is optionally crosslinked or alkylated,

(ii) a polyaminoamide resulting from the condensation of a polyalkylenepolyamine with a polycarboxylic acid and alkylated with a difunctional agent, or

(iii) a polyaminoamide obtained by reaction of a polyalkylenepolyamine comprising two primary amine groups and at least one secondary amine group with a dicarboxylic acid, the molar ratio between the polyalkylenepolyamine and the dicarboxylic acid being from 0.8:1 to 1.4:1, the resultant polyaminoamide subsequently being reacted with epichlorohydrin, the molar ratio of

epichlorohydrin to the secondary amine groups of the polyaminoamide being from 0.5:1 to 50 1.8:1.

28. A composition according to claim 2, or any one of claims 3 to 27 when appendant to

28. A composition according to claim 2, or any one of claims 3 to 27 when appendent to claim 2, wherein the cationic polymer comprises a cationic cyclopolymer which is a polymer consisting of repeat units, which may be identical or different, of formula (VIII) or a polymer consisting of repeat units, which may be identical or different, of formula (VIII)

in which:

I and t are each 0 or 1 such that the sum I+t is 1,

each R", which may be identical or different, is hydrogen or a methyl group;

R and R', which may be identical or different, are each an alkyl group containing from 1 to 22 carbon atoms, a hydroxyalkyl group or a lower amidoalkyl group, or R and R' form, together with the nitrogen to which they are attached, a heterocyclic group;

or a copolymer comprising units of formula (VII) or (VIII) and units derived from acrylamide or 20 diacetoneacrylamide;

and Yo is an anion.

29. A composition according to claim 28 wherein at least one of R and R', which may be identical or different, is a hydroxyalkyl group wherein the alkyl moiety contains from 1 to 5 carbon atoms or form, together with the nitrogen to which they are attached, a piperidyl or 25 morpholinyl group.

3. A composition according to claim 28 or 29 wherein the cationic cyclopolymer is a homopolymer of dimethyldiallylammonium chloride having a molecular weight of less than 100,000 and sold by Merck under the trade name "Merquat 100" or a copolymer of dimethyldiallylammonium chloride and an acrylamide having a molecular weight of more than 500,000 and sold under the trade name of "Merquat 550" by Merck.

31. A composition according to any one of claims 1 to 30 wherein the cationic polymer is present in an amount of from 0.05 to 5% by weight relative to the total weight of the composition.

32. A composition according to claim 2, or any one of claims 3 to 31 when appendent to 35 claim 2, wherein the reducing agent is thioglycolic acid, thiolactic acid, ammonium thiolactate or sodium metabisulphite and is present in an amount of from 0.5 to 2% by weight relative to the total weight of the composition.

33. A composition according to claim 2, or any one of claims 3 to 32 when appendant to claim 2, wherein the oxidation dye precursor is an oxidation base which is a diamine, monoaminophenol or diaminophenol, a modifier which is a meta-diamine, meta-aminophenol, phenol or polyphenol or a coupler.

34. A composition according to claim 33 wherein the oxidation base is a compound of formula:

$$45$$

$$R_{6}$$

$$R_{8}$$

$$R_{10}$$

$$R_{10}$$

$$R_{10}$$

55 in which:

BNSDOCID: ZG

R₂ and R₈, which may be identical or different, are each hydrogen or a straight or branched chain lower alkyl, mono- or polyhydroxylated alkyl, piperidinoalkyl, carbamylalkyl, dialkylcarbamylalkyl, aminoalkyl, monoalkylaminoalkyl, dialkylaminoalkyl, omega-amino-sulphonylalkyl, carboxyalkyl, alkylsulphonamidoalkyl, arylsulphonamidoalkyl, morpholinoalkyl, acylaminoalkyl, sulphoalkyl or alkoxyalkyl group, in which groups the alkyl moiety contains from 1 to 4 carbon atoms;

or R₇ and R₈ form, together with the nitrogen to which they are attached, a morpholine or piperidine heterocyclic group; and

R_B, R_B, and R₁₀, which may be identical or different, are each hydrogen, a halogen, a lower alkyl group, or a group of formula -OZ wherein Z is a hydroxyalkyl, alkoxyalkyl, acylaminoalkyl, carbalkoxyaminoalkyl, mesylaminoalkyl, ureidoalkyl, aminoalkyl, or mono- or dialkylaminoalkyl

65

55

group; or

their hydrochloride, hydrobromide, sulphate or tartrate salts;

p-aminophenol or a homologue thereof whose aromatic nucleus is substituted by at least one methyl group or by chlorine; or

N-methyl-p-aminophenol, a heterocyclic derivative of pyridine or of benzomorpholine, 5-aminoindole, orthoaminophenol, p-aminodiphenylamine or an ortho-phenylenediamine or a substituted derivative thereof;

the oxidation base being present in an amount of from 0.01 to 5% by weight relative to the total weight of the composition.

35. A composition according to claim 34 wherein at least one of R₅, R₆, R₉ and R₁₀, which may each be identical or different, is a lower alkyl group containing from 1 to 4 carbon atoms.

36. A composition according to any one of claims 33 to 35 which also comprises at least one coupler which is:

a compound of formula:

15 15

20

25

30

35

40

31

5

10

wherein:

35

40

55

60

 R_{11} and R_{12} , which may be identical or different, are each a hydroxyl group or a group of 25 formula -NHR, wherein R is hydrogen or an acyl, ureido, carbalkoxy, carbamylalkyl, alkyl, dialkylcarbamylalkyl, hydroxyalkyl or mesylaminoalkyl group, one of R11 and R12 also being able to be hydrogen or an alkoxy or alkyl group, provided that the other is a hydroxyl group;

R₁₃ and R₁₄, which may be identical or different, are each hydrogen or a halogen, an amino, alkylamino, acylamino, ureido or branched or linear alkyl group or a group of formula OZ wherein 30 Z is a hydroxyalkyl polyhydroxyalkyl, alkoxyalkyl, mesylaminoalkyl, acylaminoalkyl, ureidoalkyl or

carbalkoxyalkyl group;

alpha-naphthol; or

a heterocyclic compound derived from benzomorpholine, pyridine, a pyrazolone or a diketone compound;

the coupler being present in an amount of from 0.001 to 5% by weight relative to the total weight of the composition.

37. A composition according to any one of claims 1 to 36 wherein the cationic silicone polymer used is in the form of an emulsion containing the silicone polymer and at least one nonionic or cationic surface agent which is:

the cationic emulsion "Dow Corning 929" sold by Dow Corning and which is a combination of a) "amodimethicone" as defined in claim 7;

b) trimethylalkyl(tallow)ammonium chloride of formula:

50 wherein R₄ is a mixture of alkenyl and/or alkyl groups containing from 14 to 22 carbon atoms, 50 derived from a tallow fatty acid; and

c) polyoxyethylenated nonylphenol of formula:

$$C_9H_{19}-C_6H_4-(OC_2H_4)_{10}-OH$$
; or

the emulsion sold under the trade name "Dow Corning Q2 7224" by Dow Corning, and which is a combination of:

a) trimethylsilylamodimethicone as hereinbefore defined,

b) polyoxyethylenated octylphenyl of formula:

60

55

C₈H₁₇-C₆H₄-(OCH₂CH₂),-OH

wherein n is 40;

c) polyoxyethylenated lauryl alcohol of formula:

 $C_{12}H_{25}$ -(OCH₂-CH₂)_n-OH

wherein n is 6; and

d) glycol.

38. A composition according to any one of claims 1 to 37 which additionally comprises at least one adjuvant which is a solvent, fatty amide, fatty alcohol, nonionic or amphoteric surface agent, sequestering agent, antioxidant or perfume.

5

39. A composition according to claim 1 or 2 substantially as hereinbefore described with reference to any one of Examples 1 to 18.

40. A process for bleaching hair which comprises applying to the hair a composition as defined in any one of claims 1, or 3 to 29, 31 or 37 to 39 when appendant to claim 1, and 0.5 to 3 parts per part of the composition by weight of an oxidizing agent or solution which is hydrogen peroxide, or a persalt or a mixture thereof, leaving them in contact with the hair for a sufficient time to bleach it, after which the hair is rinsed with water and the hair is dried.

10

15

32

41. A process for dyeing hair which comprises applying to the hair a composition as defined in any one of claims 2, or 3 to 39 when appendant to claim 2, and 0.5 to 3 parts per part of the composition by weight of an oxidizing agent or solution which is hydrogen peroxide or a persalt or a mixture thereof, leaving them in contact with the hair for a sufficient time to produce the desired colour and rinsing and drying the hair.
